RACOMMENDATION FOR APPLICATION OF AGROSTEMIN ON "BURLEY" VARIETY TOBACCO

Based on four years testing of bioregulator "Agrostemin" and its effects on tobacco variety Burley hereby we confirm the following:

The best results were achieved by spraying of tobacco plants in the phase of growth from 9 to 11 leaves in concentration 75 g/ha of AGROSTEMIN® – "gold", or 750 g/ha of AGROSTEMIN® – "green".

For spraying of 1 ha it is necessary to dissolve the mentioned quantity of Agrostemin in 600 liters of water.

EXAMINER IN CHARGE,

DIRECTOR OF THE INSTITUTE,

Application: as per regulations, **three times** during the season.

First time: with a seed (whether submerge into solution, or, to dust*) with **30 g "gold"** or spraying the nursery plants with **30 g "gold"** (or **300 g "green"**) per hectare **of nursery** at the phase "rooting seedlings" (period of 1 – 3 leaves)

Second time: to spray with **75 g/ha "gold"** (or **750 g/ha "green"**) in the period of 3 – 7 days upon transplantation by dividing a dissolved quantity of powder to a previously prepared solution of other preparations for treatment of one ha (it does not require a separate passage), more precisely, to a quantity of water necessary for **spraying of one ha**.

Third time: to spray with **75 g/ha "gold"** (or **750 g/ha "green"**) in the period of 9 – 11 leaves, as specified in the preceding paragraph.

Recommendation: in other terms to spray simultaneously with application of other chemical protection preparations with 150g/ha **"green"** (or 15g/ha **"gold"**) for more successful recovery.

COMPLETELY HARMLESS FOR PEOPLE, ANIMALS (INCLUDING BEES) AND ENVIRONMENT;
IT DOES NOT REQUIRE SPECIAL MEASURES OF HYGIENIC AND TECHNICAL PROTECTION **)
